## Permutation

A permutation is an arrangement of objects in a specific order. The number of permutations of  $n$  objects is given by the factorial of  $n$ , denoted as  $n!$ . For

example, if you have three letters A, B, and C, you can arrange them in  $3! = 6$  different ways: ABC, ACB, BAC, BCA, CAB, and CBA.

**Fundamental Counting Principle:** The fundamental counting principle states that if there are  $m$  ways to perform one task and  $n$  ways to perform another task, then there are  $m \times n$  ways to perform both tasks.

**Permutations with Repetition:** If an object can be repeated in the arrangement, the number of permutations with repetition is given by  $n^r$ , where  $n$  is the number of objects and  $r$  is the number of arrangements. For example, if you have three coins (H, T, and T), you can arrange them in  $3^3 = 27$  different ways.

## Combination

A combination is a selection of objects without regard to order. The number of combinations of  $n$  objects taken  $r$  at a time is given by the following formula:

$$C(n, r) = \frac{n!}{r! \cdot (n - r)!}$$

For example, if you have five fruits (apple, orange, banana, mango, and pineapple) and you want to select three fruits, you can do so in 10 different ways:

\* Apple, orange, banana \* Apple, orange, mango \* Apple, orange, pineapple \* Apple, banana, mango \* Apple, banana, pineapple \* Orange, banana, mango \* Orange, banana, pineapple \* Orange, mango, pineapple \* Banana, mango, pineapple \* Apple, orange, mango, pineapple

**Combinations with Repetition:** If an object can be repeated in the selection, the number of combinations with repetition is given by  $(n + r - 1)! / (r! * (n - 1)!)$ . For example, if you have three coins (H, T, and T), you can select them in  $4! / (3! * 1!) = 4$  different ways:

\* H, T, T \* H, T, T \* T, T, H \* T, T, T

## Probability

Probability measures the likelihood of an event occurring. It ranges from 0 (impossible) to 1 (certain). The probability of an event A is denoted as  $P(A)$ .

### Basic Rules of Probability:

\*  $P(A) \geq 0$  for all events A. \*  $P(S) = 1$ , where S is the sample space (the set of all possible outcomes). \* If A and B are mutually exclusive events (they cannot occur at the same time), then  $P(A \text{ or } B) = P(A) + P(B)$ .

**Conditional Probability:** The conditional probability of event A given event B has occurred is denoted as  $P(A|B)$  and is calculated as follows:

$$P(A|B) = P(A \text{ and } B) / P(B)$$

**Independent Events:** Two events are independent if the occurrence of one event does not affect the probability of the other event. For independent events A and B,  $P(A \text{ and } B) = P(A) * P(B)$ .

**Mutually Exclusive Events:** Two events are mutually exclusive if they cannot occur at the same time. For mutually exclusive events A and B,  $P(A \text{ or } B) = P(A) + P(B)$ .

**Bayes' Theorem:** Bayes' theorem is used to calculate the probability of an event based on prior knowledge. It is expressed as follows:

$$P(A|B) = P(B|A) * P(A) / P(B)$$

## Applications of Permutation, Combination, and Probability

Permutation, combination, and probability have numerous applications in various fields:

- \* **Statistics:** To calculate probabilities, determine confidence intervals, and conduct hypothesis testing.
- \* **Data Analysis:** To analyze data, identify patterns, and make predictions.
- \* **Computer Science:** To solve combinatorial problems, design algorithms, and analyze data structures.
- \* **Everyday Life:** To calculate odds in games, probability of winning lotteries, and expected outcomes in decision making.

Permutation, combination, and probability are essential concepts that provide a powerful framework for solving problems and making informed decisions. By understanding the fundamental principles and formulas, you can master these topics and apply them to various aspects
