## A Geological Masterpiece: The Formation of the White Cliffs

The White Cliffs of Samuel José Barro owe their existence to a remarkable geological process that began millions of years ago. As the ancient ocean floor rose to form the Iberian Peninsula, layers of marine sediments, primarily composed of calcium carbonate, were deposited and compressed over time. Over countless millennia, these sediments underwent a process of lithification, transforming into the soft, white chalk that characterizes the cliffs today.

The cliffs' distinctive white coloration results from the pure calcite content of the chalk, which reflects sunlight effectively. This remarkable geological

formation has remained largely untouched by erosion, preserving its pristine beauty for generations to come.
